2 ABSTRACT OF THE DISCLOSURE

3

4 A reusable compact device having a T-shaped plate with a tapering end, a cross member end, a  
5 central aperture, and a darkened perpendicular line between the aperture and cross member.  
6 When the golfer places the plate at ground level, points its tapering end toward the desired flight  
7 path of his/her ball, inserts a tee through the aperture and partially into the ground, places a golf  
8 ball upon the tee, self-aligns with the plate's tapering end, aligns the club face with the plate's  
9 cross member, and centers the club face to the exact ball center using the darkened perpendicular  
10 line, the golfer does not have to look up, position and stance are not lost during the swing, and  
11 the resulting swing is straightened, with improved accuracy and consistency in launching a golf  
12 ball along an intended flight path. Optionally, grooved tees are used to adjust ball height  
13 according to club type.
